CLAIMS:

1. A tool for directing bone replacement material into a defined space comprising:
 - a) an elongated hollow tube having a proximal and a distal end, said proximal end being adapted for attachment to a source of bone replacement material under pressure; and
 - b) said distal end including at least one deflector opening for deflecting bone replacement material out of said tube at an angle relative to a longitudinal axis of said tube.
2. The tool of claim 1 wherein each said deflector opening has a length of between about $1\frac{1}{2}$ to $3D$, wherein D is the diameter of said tube.
3. The tool of claim 1 wherein each said deflector opening includes a deflector for deflecting bone replacement material from said tube through said deflector opening.
4. The tool of claim 3 including two opposing deflector openings and said deflector is a tapered wedge adjacent the distal end of said tube.
5. The tool of claim 3 including a single deflector opening and said deflector presents an angled ramp to said deflector opening.
6. The tool of claim 5 wherein said distal end of said tube is closed or open up to $\frac{1}{2}D$, wherein D is the diameter of said tube.
